

Modernization

Our qualified crane technicians are trained to carry out structural, mechanical and electrical modifications which can adapt your existing cranes to meet changed requirements. Rather than scrap an outdated crane, which is still structurally sound, it makes good economic sense to upgrade and modify the unit to meet current operational needs. All crane conversions are fully planned by our engineering department. Upon completion of the project, we provide full documentation, testing and re-certification of the upgraded unit.

Our conversions can include crane rewiring, converting manual operation to motorized control, converting cab controlled cranes to floor, radio remote or dual control. Cabs can be removed, relocated or altered, and crane spans changed to suit new locations. Crane runways can be realigned and leveled.
